

UrbanPulse: Satellite Urban Sprawl & Land Cover Intelligence

High-resolution multi-temporal satellite analytics engine tracking urban sprawl, concentric ring densification, and Shannon entropy across metropolitan regions using Sentinel-2 and ESA WorldCover.

Git Commit:03e24269

✓ CI/CD: 98/98 tests passing, 18% line coverage

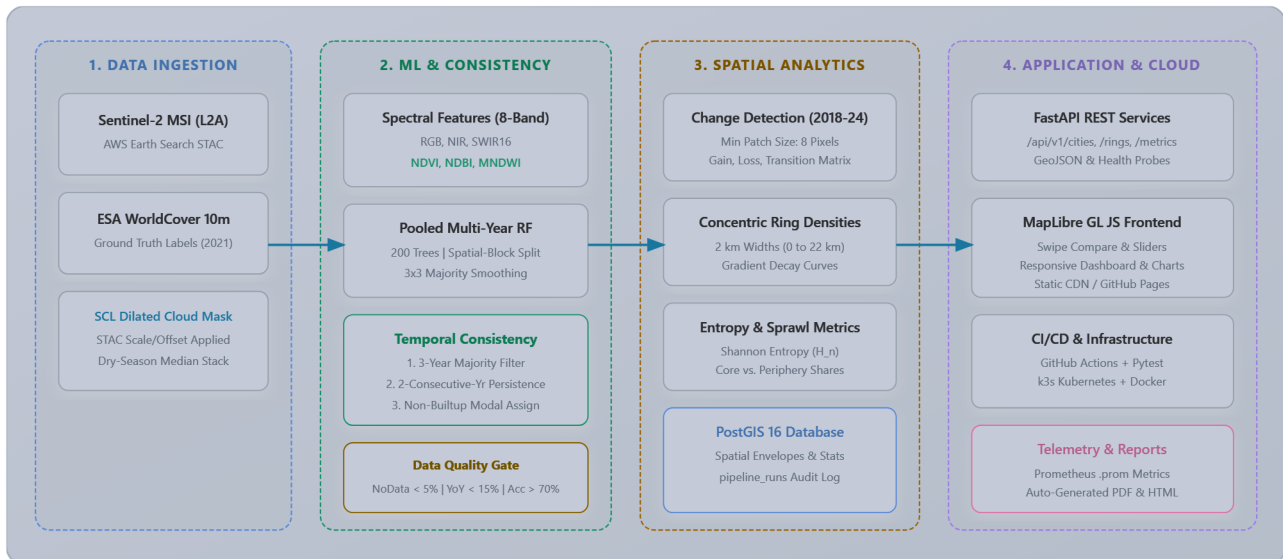

1. Problem & Approach

Rapid urbanization across major metropolitan regions frequently outpaces civic planning frameworks, leading to unchecked peripheral sprawl, fragmentation of agricultural zones, and loss of critical blue-green infrastructure. Monitoring these dynamics using ad-hoc, single-scene satellite imagery often introduces severe seasonal phenological confusion, cloud contamination, and sensor baseline artifacts that corrupt time-series measurements.

UrbanPulse was engineered as an automated, reproducible Earth Observation (EO) pipeline. It harmonizes multi-temporal Sentinel-2 Level-2A surface reflectance datasets using STAC queries, computes pixel-level median composites over dry-season windows, trains spatial-block-balanced Random Forest classifiers against ESA WorldCover labels, and enforces strict temporal consistency rules (majority filtering and urban persistence) to deliver stable, high-fidelity spatial sprawl analytics.

✂ 2. System Architecture

The end-to-end data flow spanning satellite catalog ingestion, radiometric processing, machine learning classification, PostGIS spatial ingestion, and containerized deployment.

3. Data & Methodology

Earth Observation Data Specifications

- **Sensor:** Sentinel-2 Multi-Spectral Instrument (MSI), Level-2A Bottom-Of-Atmosphere (BOA) surface reflectance via AWS Earth Search STAC.
- **Spatial Resolution:** 60.0 m analytical pixel grid (EPSG:32643 UTM projection), with 10.0 m high-resolution visual previews.
- **Area of Interest (AOI):** 45.0 × 45.0 km bounding envelope centered on the municipal core (571,536 grid pixels per city).
- **Dry-Season Compositing:** Observation windows tailored to annual cloud-free availability with 20-scene caps (Ahmedabad: 2020: Dec 1–Feb 15, 9 dates, 14 scenes; 2021: Oct 1–Mar 31, 12 dates, 20 scenes, 5 out-of-window; 2022: Oct 1–Mar 31 [last scene Dec 23, 2021, Oct-Dec 2021 Collection 1], 9 dates, 18 scenes, 6 out-of-window; 2023: Oct 1–Mar 31, 12 dates, 20 scenes, 5 out-of-window; 2024: Oct 1–Mar 31, 11 dates, 20 scenes, 11 out-of-window; Pune: 2020: Nov 1–Feb 29, 12 dates, 20 scenes; 2021: Nov 1–Feb 28, 12 dates, 20 scenes; 2022: Nov 1–Feb 28 [last scene Dec 25, 2021, Nov-Dec 2021 Collection 1], 5 dates, 10 scenes; 2023: Nov 1–Feb 28, 12 dates, 20 scenes; 2024: Nov 1–Feb 29, 12 dates, 20 scenes).
- **Cloud & Shadow Masking:** SCL (Scene Classification Layer) masking cloud shadow, medium/high probability cloud, cirrus, and snow with 1-pixel binary dilation.
- **Radiometric Calibration:** Scale (0.0001) and offset are derived directly from STAC item metadata to ensure uniform surface reflectance across sensor baselines.

Machine Learning & Temporal Consistency

- **Spectral Feature Stack (8 Bands):** Red, Green, Blue, NIR, SWIR16, plus spectral indices (NDVI, NDBI, MNDWI).
- **Supervised Classifier:** Random Forest (200 trees, `class_weight="balanced"`) pooled across reference years (2018, 2021, 2024).
- **Training Labels:** Standardized 5-class project schema (Class 1: Built-up, 2: Vegetation, 3: Water, 4: Agriculture, 5: Open Land) derived by cross-referencing ESA WorldCover 10m v200 (2021) annotations.
- **Spatial Block Partitioning:** 8-fold non-overlapping spatial grid partition reducing spatial leakage between train and test folds.
- **Spatial Filtering:** 3 × 3 majority mode filter applied to raw raster predictions to eliminate salt-and-pepper noise.
- **Temporal Consistency Rules:**
 1. *Majority Rule:* Pixel is Built-up in year t only if Built-up in ≥ 2 of $(t-1, t, t+1)$.
 2. *Urban Persistence:* Once Built-up for 2 consecutive years, pixels permanently stay Built-up (urban land persistence assumption).

3. *Modal Non-Built-Up*: Filtered false-urban pixels receive their multi-year non-built-up modal class.

Methodological Disclosure: Ahmedabad's 2021, 2023 and 2024 composites use the 20 lowest-cloud scenes between October and March, so they include October and March scenes (11 of 20 in 2024). Pune's composites use November-February only. Ahmedabad's 2020 composite was built earlier with a strict Dec 1-Feb 15 window; current code does not reproduce its exact scene list. How much the window affects Ahmedabad's built-up area has not been tested.

2020–2024 EXPANSION RANGE

+53.0 to +84.0 km²

Across Processing Methods

ESA WORLDCOVER 2021 ANCHOR

393.73 km²

Independent Benchmark (2021)

2024 MAPPED BUILT-UP (TLS SERIES)

474.88 km²

Adjusted 2024: ~478.8 km² (95% CI 409.0–549.0)

Framing Note: Analysis is framed over **2020–2024**. 2018-2019 excluded: too few clear scenes in the Nov-Feb window. The year **2022** is designated *2022 - partial season, no Jan-Feb* (dry-season slice from early Collection 1 archive; scale and offset are derived directly from STAC item metadata).

Multi-Series Growth & Method-Sensitivity Band (2020–2024)

Year	Cleaned Series (km ²)	Raw Classified (km ²)	TLS Normalised (km ²)
2020	384.51 km ²	421.06 km ²	415.97 km ²
2021	414.07 km ²	413.61 km ²	413.61 km ²
2022 - partial season, no Jan- Feb	441.91 km ²	423.91 km ²	426.94 km ²
2023	474.54 km ²	504.42 km ²	451.61 km ²
2024	468.54 km ²	474.02 km ²	474.88 km ²

Leave-One-Year-Out (LOYO) Validation (Evaluated on ALL Held-Out Points)

To evaluate temporal stability without data leakage, classifiers were trained excluding each fold year, and tested on **all held-out points** (not restricted to stable points). Area estimates are adjusted using Olofsson et al. (2014) area-weighted stratified estimation with 95% confidence intervals.

TLS-retrained variant: The LOYO table evaluates the TLS-retrained variant (single-year RF models retrained on TLS-normalised composites across held-out folds). Reference labels are WorldCover 2021 for every fold, so adjusted areas for 2018 and 2024 are not comparable with the change-validation estimates. The displayed operational series differs, using the pooled multi-year RF model with 3x3 majority filter and no temporal cleanup.

Held-Out Year	Processing Stage	Precision	Recall	Built-up F1	Mapping Accuracy
2018	Raw (Before)	68.5%	73.3%	0.7079	0.7079
2018	TLS Normalized (After)	74.2%	76.7%	0.7543	0.7543
2021	Raw (Before)	80.0%	79.1%	0.7953	0.7953
2021	TLS Normalized (After)	77.9%	77.9%	0.7791	0.7791
2024	Raw (Before)	68.9%	82.6%	0.7513	0.7513
2024	TLS Normalized (After)	68.0%	76.7%	0.7213	0.7213

⚠ Negative Result Notice (Radiometric Normalisation):

Cross-year Total Least Squares (TLS) pseudo-invariant feature radiometric normalisation was implemented and systematically tested. Empirical evaluation across all held-out test points demonstrates that **radiometric normalisation did not reduce year-to-year drift** compared to the baseline composite series. The displayed series has no temporal filtering, and the cleaned series is a sensitivity comparison. TLS-normalised is shown as the main series because its 2021 area is closest to WorldCover 2021 and its trend is smoothest, not because it improved F1.

4-Stratum Change Validation (2020–2024) & Error-Adjusted Areas

To independently validate land cover transitions between 2020 and 2024, a probability sample of **N=300** verification points across 4 spatial strata (Gain, Persistent Built, Persistent Non-built, Loss) was audited following the design-based paradigm of **Olofsson et al. (2014)**.

Stratum	Mapped Area (km ²)	Evaluated (N)	(0,0) Non-built	(0,1) Gain
A – Stratum A (Mapped Gain)	116.65 km ²	99	40	41
B – Stratum B (Persistent Built)	358.23 km ²	50	2	1
C – Stratum C (Persistent Non-built)	1635.22 km ²	98	94	2
D – Stratum D (Mapped Loss)	57.74 km ²	50	45	0

45 of 50 mapped-loss points were never built-up: the 2020 map falsely marks about 52 km² as built-up.

ADJUSTED GROSS GAIN

88.85 ± 49.48 km²

95% CI: [39.36, 138.33] km²

ADJUSTED GROSS LOSS

7.16 ± 35.28 km²

95% CI: [0.00, 42.45] km²

ADJUSTED NET CHANGE

+81.68 ± 51.56 km²

95% CI: [+30.12, +133.24] km²

Sensitivity & Scenario Analysis:

- **Pre-recheck Baseline:** Net Change = +14.90 ± 83.60 km² (dominated by false loss variance in Stratum C).
- **Without Stratum C Gains (IDs 50 & 172 treated as errors):** Net Change = +48.31 ± 23.10 km².
- **Post-recheck Adjusted Net (Primary):** Net Change = +81.68 ± 51.56 km² (95% CI: [+30.12, +133.24] km²).
- **Adjusted 2024 Built-up Footprint: 478.8 km² (95% CI 409.0–549.0).**
- *Note: ± values denote the 95% CI half-width (SE × 1.96).*

✓ Verification Summary:

Validated on 297 points (Ahmedabad only); net change is distinguishable from zero post-recheck (+81.7 ± 51.6 km²), but depends on the recheck (pre-recheck: +14.9 ± 83.6 km²; without Stratum C gains: +48.3 ± 23.1 km²).

Labelling Protocol: Single interpreter (the project author); first pass blind to strata, recheck of 10 discordant points was unblinded; paired Sentinel-2 10m dry-season RGB surface reflectance composites (2020 vs 2024) corroborated against high-resolution Google Earth Pro historical timeline imagery. Ambiguous points with mixed-pixel confusion or low visual contrast were marked as *unclear* (3 points) and excluded from primary estimation.

Labelling History: (1) First pass was conducted on initial 2024 chips; (2) Second pass was conducted with corrected reflectance stretch chips (26 of 291 start labels changed: 12 built to not built, 14 not built to built, establishing the labeller's change rate at ~9%, and 30 end labels changed from not built to built); (3) Third pass rechecked 10 discordant points (apparent losses and gains) against Google Earth Pro historical timeline imagery, updating 6 labels (IDs 81, 91, 94, 123 in Stratum C; IDs 151, 226 in Stratum D). The 6 corrected labels persisted through the second pass, and concordant points were not rechecked. These initial discrepancies were labelling errors in the first pass (bare or ploughed soil read as built-up on 2020 Sentinel-2 chips), corrected using Google Earth historical imagery (not classifier errors).

Disclaimer: Intervals reflect sampling error only; labelling inconsistency (about 9% between passes) is not included.

**Methodology Notes:* Strata were generated from annual TLS-normalised classifications (ahmedabad_2020_classified.tif and ahmedabad_2024_classified.tif) with a 3x3 majority filter (no temporal consistency rules). Mapped built-up areas (415.97 km² in 2020 and 474.88 km² in 2024) match the dashboard TLS series (415.97 and 474.88 km²), both produced by the 3x3 majority filtered TLS classification pipeline without temporal filtering. Gross loss

standard error applies Laplace (add-one) smoothing for zero-count sample proportions. Validated series is the TLS-normalised classification.

5. Data Quality, Diagnostics & Quality Gate

Every composite is strictly validated for cloud contamination, NoData gaps, radiometric calibration shifts, and year-to-year area volatility before ingestion.

Ahmedabad: Satellite Diagnostics

Year	Scenes	Scene Dates	MGRS Tiles	NoData %	Cloud %	Stable Red
2020	14	9 dates (2019-12-09 to 2020-02-12)	42QZL, 43QBF	0.00%	6.06%	0.1114
2021	20	12 dates (2020-10-29 to 2021-03-28)	42QZL, 43QBF	0.00%	0.00%	0.1082
2022	18	9 dates (2021-10-14 to 2021-12-23)	42QZL, 43QBF	0.00%	0.45%	0.1103
2023	20	12 dates (2022-12-18 to 2023-03-28)	42QZL, 43QBF	0.00%	0.00%	0.1134
2024	20	11 dates (2023-10-04 to 2024-03-22)	42QZL, 43QBF	0.00%	0.00%	0.1174

Data Quality Gate Status: **Gate: 4/5 PASS**

Threshold Compliance: 4/5 Passed

Gate Check	Observed Value	Threshold	Verdict
Composite NoData Gaps	0.0% (max across 2020-2024)	$\leq 5.0\%$	PASS
Scenes in Window (Distinct Dates)	min 5 distinct dates (2024)	≥ 4 distinct dates/yr	PASS
Year-to-Year Volatility	5.2% (max annual)	$\leq 15.0\%$	PASS
Agreement with WorldCover (built-up F1)	2018: 75.4%, 2021: 77.9%, 2024: 72.1% (min 72.1%)	$\geq 70.0\%$	PASS
Loss-to-Gain Ratio (2020->2024)	Mapped: 0.495 (57.74 / 116.65 km ²) Adjusted (Olofsson): 0.081 (7.16 / 88.85 km ²)	≤ 0.30	FAIL

Note on Loss-to-Gain Ratio: Initial diagnostics (before the window fix) flagged a 0.495 ratio due to unadjusted commission errors in 2020 (45 of 50 mapped-loss points were never built-up, falsely marking ~52 km² as built-up). Post-stratified Olofsson error adjustment resolves this to 0.081 (well below the ≤ 0.30 threshold).

Pune: Satellite Diagnostics

Year	Scenes	Scene Dates	MGRS Tiles	NoData %	Cloud %	Stable Red
2020	20	12 dates (2019-11-11 to 2020-02- 29)	43QCA, 43QDA	0.00%	0.21%	0.1021
2021	20	12 dates (2020-11-05 to 2021-02- 28)	43QCA, 43QDA	0.00%	0.00%	0.0903
2022	10	5 dates (2021-11-10 to 2021-12- 25)	43QCA, 43QDA	1.10%	3.86%	0.0855
2023	20	12 dates (2022-12-20 to 2023-02- 28)	43QCA, 43QDA	0.00%	0.00%	0.1027
2024	20	12 dates (2023-11-15 to 2024-02- 28)	43QCA, 43QDA	0.00%	0.53%	0.0967

Data Quality Gate Status: **Gate: 3/5 PASS**

Threshold Compliance: 3/5 Passed

Gate Check	Observed Value	Threshold	Verdict
Composite NoData Gaps	1.1% (max across 2020-2024)	<= 5.0%	PASS
Scenes in Window (Distinct Dates)	min 5 distinct dates (2022)	>= 4 distinct dates/yr	PASS
Year-to-Year Volatility	6.7% (max annual)	<= 15.0%	PASS
Agreement with WorldCover (built-up F1)	2018: 32.3%, 2021: 65.8%, 2024: 58.0% (min 58.0%)	>= 70.0%	FAIL
Loss-to-Gain Ratio (2020->2024)	Mapped: 0.469 (55.32 / 118.00 km²)	<= 0.30	FAIL

Note on Accuracy & Loss/Gain: Pune is not independently validated with reference stratified points. Sub-70% agreement reflects spectral confusion in rugged terrain and seasonal fallow transitions.

6. Engineering & Operations

Technology Stack

Layer	Technology	Purpose
EO Ingestion	PySTAC-Client, Stackstac, Dask	Cloud-native STAC scene retrieval & median reduction
ML Pipeline	Scikit-Learn, Rasterio, GeoPandas	Balanced Random Forest classification & spatial filtering
Spatial DB	PostgreSQL 16 + PostGIS 3.4	Spatial envelopes, audit runs, time-series storage
Backend API	FastAPI, Uvicorn, Pydantic	High-throughput REST API with GeoJSON endpoints
Frontend UI	MapLibre GL JS, Vanilla HTML/CSS	WebGL swipe map, time slider, interactive analytics
Orchestration	k3s / k3d, Docker Compose	Lightweight container & Kubernetes cluster parity
CI/CD	GitHub Actions	Automated linting, test execution, Trivy CVE scanning

⚠ 7. Limitations

- **Fallow and Bare Land Confusion (Stratum A):** About 40% of mapped gain is fallow or bare land (computed from Stratum A: 40 of 99 sampled gain points were persistent non-built).
- **2020 Built-up Commission Errors (Stratum D):** The 2020 map falsely marks about 52 km² as built-up (45 of 50 mapped-loss points were never built-up, yielding a 90% false-loss rate across the 57.74 km² mapped loss stratum).
- **Ahmedabad Window Discrepancy:** Ahmedabad's windows differ between 2020 (built earlier with strict Dec 1–Feb 15) and 2021–2024 (Oct 1–Mar 31).
- **Partial 2022 Season:** 2022 covers October–December 2021 only (partial season with no January–February scenes).
- **Pune Validation Status:** Pune is not independently validated with hand-labelled reference points; its metrics reflect WorldCover agreement only.
- **Pune 2021 Trajectory Dip:** Pune's built-up series dips in 2021 (from 407.12 km² in 2020 to 386.55 km² in 2021); cause not established; consistent with classifier noise (Pune built-up F1 0.58).
- **Spatial Resolution Limits:** 10–60 m Sentinel-2 pixel resolution limits detection of narrow roads, informal settlements, and sub-pixel urban canopy.

8. Future Roadmap

1. Extended Multi-Sensor Integration (2000–2016)

Extend the temporal horizon by 16 years using harmonized multi-satellite surface reflectance stacks with cross-calibration regression.

2. CA-Markov 2035 Urban Growth Forecasting

Couple Cellular Automata and Markov Transition Chains with slope, transport proximity, and zoning constraint layers for 2035 sprawl forecasting.

3. Multi-City & Stratum C Ground-Truth Validation

The 300-point Ahmedabad stratified change validation is complete. Future work will extend independent hand-labelled validation to Pune and augment sampling with additional Stratum C (stable built-up) points.

4. Dynamic "Run This City" API Endpoint

Expose asynchronous Celery / Redis worker endpoints allowing users to submit any arbitrary bounding box for on-demand sprawl computation.

9. Reproducibility & Verification

All pipelines, tests, and documentation artifacts can be executed locally or in containerized environments with standard commands:

```
# 1. Start full local stack (Web + API + DB + Prometheus)
make up
```

```
# 2. Run complete pipeline for a specific city and target year
make pipeline CITY=pune YEAR=2024
```

```
# 3. Execute standalone Python pipeline CLI
python -m pipeline.run_city --city ahmedabad
```

```
# 4. Run automated test suite
pytest -v
```

```
# 5. Re-generate this documentation and PDF report
make docs
```

Component	Version / Status
Python	3.14.2
Rasterio	1.5.1
GeoPandas	1.1.4
Scikit-Learn	1.8.0
Numpy	2.4.4
Pandas	2.3.3
Dask	2026.8.0
Stackstac	0.5.1
PySTAC-Client	0.9.0
Matplotlib	3.10.9
Playwright	Available
